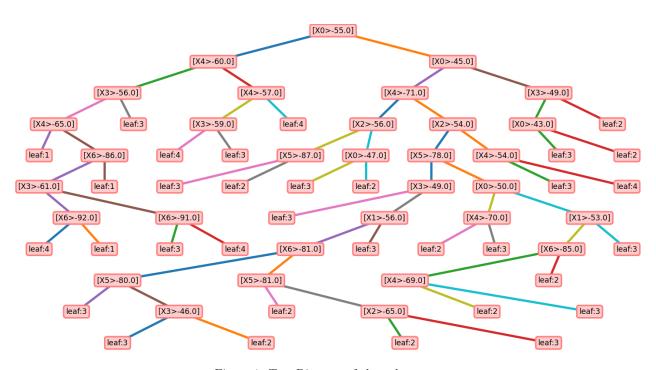

Figure 1: Tree Diagram of clean data set

## 1 Evaluation

#### 1.1 10-Folds Cross validation classification metrics

	Room1	Room2	Room3	Room4
	Predicted	Predicted	Predicted	Predicted
Room1 Actual	49.7	0.	0.1	0.2
Room2 Actual	0.	48.	2.	0.
Room3 Actual	0.5	1.9	47.4	0.2
Room4 Actual	0.4	0.	0.25	49.5

Table 1: Clean set confusion matrix.

	Room1	Room2	Room3	Room4
	Predicted	Predicted	Predicted	Predicted
Room1 Actual	39.1	2.8	3.	4.1
Room2 Actual	3.	40.7	3.	3.
Room3 Actual	3.3	3.5	42.2	2.5
Room4 Actual	3.9	2.1	2.7	41.1

Table 2: Noisy set confusion matrix.

	Precision	Recall	F1-score	Accuracy	$\sigma_{Accuracy}$	
Room1	0.9822	0.994	0.9881			
Room2	0.9619	0.96	0.9610	0.9730	0.0103	
Room3	0.9556	0.948	0.9518	0.9750	0.0103	
Room4	0.9920	0.99	0.9910			

Table 3: Clean set metrics.

	Precision	Recall	F1-score	Accuracy	$\sigma_{Accuracy}$	
Room1	0.7931	0.7980	0.7955			
Room2	0.8289	0.8189	0.8239	0.8155	0.0351	
Room3	0.8291	0.8194	0.8242	0.0100	0.0331	
Room4	0.8107	0.8253	0.8179			

Table 4: Noisy set metrics.

#### 1.2 Result analysis

Among the four rooms in the clean set, Room2 and Room3 are relatively low in precision, recall, and f1-score. These two rooms are confused as their confusing cases are the highest beside the diagonal shown in the confusion matrix. In comparison, Room4 has the highest performance among all the metrics. Regarding the noisy set, Room1 and Room4 has the least accuracy and are confused, as most false predictions lie between them in the confusion matrix. Moreover, the same performance is shown in predicting Room3 and Room2.

#### 1.3 Dataset differences

In contrast to the noisy dataset, all the rooms in the clean dataset perform much better in all metrics. According to the training algorithm, a decision tree must separate the training set into subsets with a pure label to reach the optimal information gain. Hence, each noisy data is considered and captured by the model. Different labels may mix up in high-dimensional space due to noise. Thus more nodes are needed to separate them, resulting in a more complex tree, which leads to overfitting and poor generalization performance.

# 2 Pruning - evaluation

# 2.1 Cross validation classification metrics after pruning

		Room1	Room2	Room3	Room4
		Predicted	Predicted	Predicted	Predicted
Room1 Actual	Before	49.3	0.	0.367	0.333
Roomi Actual	After	49.6	0.	0.38	0.01
Room2 Actual	Before	0.	47.9	2.1	0.
Roomz Actual	After	0.	47.62	2.38	0.
Room3 Actual	Before	0.2	1.9	47.51	0.39
Rooms Actual	After	0.69	2.09	46.8	0.46
Room4 Actual	Before	0.37	0.	0.18	49.5
	After	0.45	0.	0.26	49.29

Table 5: Clean set confusion matrix before and after pruning.

		Room1	Room2	Room3	Room4
		Predicted	Predicted	Predicted	Predicted
Room1 Actual	Before	38.3	3.43	3.22	4.03
100iiii Actuai	After	44.	1.3	1.4	2.26
Room2 Actual	Before	3.	39.79	4.07	2.84
	After	1.9	44.04	2.54	1.21
Room3 Actual	Before	2.87	3.66	41.83	3.14
10001113 Actual	After	2.22	3.31	44.08	1.89
Room4 Actual	Before	3.72	2.48	3.43	40.17
	After	2.52	1.43	1.71	44.13

Table 6: Noisy set confusion matrix before and after pruning.

		Precision	Recall	F1-score		Accuracy	$\sigma_{Accuracy}$	$\mathrm{Depth}_{avg}$
Room1	Before	0.9886	0.986	0.9873				
ROOMIT	After	0.9775	0.9922	0.9848	Before	0.9708	0.0144	11.88
Room2	Before	0.9618	0.958	0.9599	Defore	0.9708	0.0144	11.66
ROOMZ	After 0.9580 0.9524 0.9552							
Room3	Before	0.9473	0.9502	0.9487				
Rooms	After	0.939	0.9404	0.9432	After	0.9664	0.0157	8.29
Room4	Before	0.9811	0.988	0.9846	Aitei	0.9004	0.0137	0.29
1001114	After	0.9870	0.9870	0.9870				

Table 7: Clean set metrics before and after pruning.

		Precision	Recall	F1-score		Accuracy	$\sigma_{Accuracy}$	$\mathrm{Depth}_{avg}$
Room1	Before	0.7998	0.7819	0.7907				
ROOMII	After	0.8688	0.8980	0.8831	Before	0.8005	0.0288	18.28
Room2	Before	0.8062	0.8006	0.8034	Delote	0.8003	0.0200	16.26
ROOMZ	After	0.8793	0.8862	0.8828				
Room3	Before	0.7960	0.8123	0.8041				
1,001113	After	0.8855	0.8559	0.8704	After	0.8813	0.0288	13.42
Room4	Before	0.8003	0.8066	0.8034	Aitei	0.6613	0.0200	13.42
1001114	After	0.8918	0.8862	0.8870				

Table 8: Noisy set metrics before and after pruning.

### 2.2 Result analysis after pruning

A slight decrease in average accuracy is shown after pruning for the clean set because of the loss of non-noisy information captured within the train set. In contrast, the accuracy increased considerably in the noisy dataset after pruning. Pruning eliminated the captured noise by replacing nodes with the dominant label set when accuracy remains reasonable, resulting in a less overfitted decision tree with a higher bias and lower variance than before.

### 2.3 Depth analysis

The tree trained on the noisy dataset is shown to have a much larger depth than the clean dataset because more nodes are needed to separate data under the noisy data pattern. Pruning resulted in a tree with less average depth on both datasets, with prediction accuracy increasing in the noisy dataset and a mighty decrease in the clean set. Overall, the tree's generalization performance increases with less complexity and smaller maximum depth.
